Associate Director and Associate Professor

School of Natural Resources and the Environment

In my large-enrollment General Education Exploring Perspectives-Artist online course, WFSC 140 *Wildlife at the Movies*, I use GenAI as part of a sequence of five writing and revision assignments focused on film criticism, creativity, and thinking like an artist. Students first use GenAI to generate film reviews in the voice of a specific film critic, then revise the AI-generated review to better align with concepts discussed in each module alongside their own interpretation of the film. As part of each assignment, students also evaluate how effectively the GenAI captures the critic's style, tone, perspective, and analytical approach. Rather than treating GenAI as a shortcut for writing, the assignments ask students to reflect and improve aspects of authorship, audience, interpretation, revision, and artistic voice treating GenAI as a learning tool. I have found that this process encourages students to engage differently and seemingly more deeply with writing, film analysis, and the creative decisions involved in storytelling and criticism than when they generate content independently from scratch.

Through the AI Campus Champions Cohort, I will develop and pilot a scalable instructional toolkit titled *GenAI and Artistic Voice: A Framework for Critical and Creative Revision in Large Online Courses*. The project will produce a fully implementable package consisting of: (1) five sequenced GenAI-supported writing and revision modules; (2) adaptable assignment prompts aligned with learning outcomes in critical analysis, revision, and reflective writing; (3) standardized grading rubrics and streamlined assessment workflows designed for courses enrolling 300+ students; (4) structured student reflection templates focused on authorship, creativity, and ethical GenAI use; and (5) concise instructor implementation guides that include recommended GenAI prompts, example student workflows, academic integrity considerations, and strategies for adapting the activities across disciplines. During the six-week program, I will revise and test these materials for use in WFSC 140 while simultaneously designing them for transferability to other General Education and writing-intensive courses at the University of Arizona. The final deliverable will include a shareable digital toolkit and example student artifacts that will be disseminated through University of Arizona teaching and learning communities, including University Center for Assessment, Teaching and Technology, Writing Across the Curriculum, and the University of Arizona Libraries, as a model for integrating GenAI into revision-centered pedagogy. This toolkit will eventually be shared with practitioners at other institutions through a journal like *Prompt: A Journal of Academic Writing Assignments*. More broadly, this project positions GenAI as a learning tool for critical inquiry, interpretation, and creative revision while helping students strengthen their own analytical voice, artistic perspective, and reflective thinking skills.
